

# Introductions to LCM

## Introduction to the GCD and LCM (greatest common divisor and least common multiple)

### General

The legendary Greek mathematician Euclid (ca. 325–270 BC) suggested an algorithm for finding the greatest common divisor of two integers, which was later named the Euclidean algorithm. This algorithm, as well as computationally refined versions, are in widespread use today.

### Definitions of GCD and LCM

The GCD and LCM group of functions includes the following three functions:

- the greatest common divisor (gcd):  $\text{gcd}(n_1, n_2, \dots, n_m)$
- the least common multiple (lcm):  $\text{lcm}(n_1, n_2, \dots, n_m)$
- the extended greatest common divisor (egcd):  $\text{egcd}(n_1, n_2, \dots, n_m)$

These functions are defined in the following ways:

$$\text{gcd}(n_1, n_2, \dots, n_m) = p /; p \in \mathbb{Z} \bigwedge \frac{n_k}{p} \in \mathbb{Z} \bigwedge 1 \leq k \leq m \bigwedge \left( \neg \exists_q (q \in \mathbb{Z} \wedge q > p) \bigwedge \frac{n_k}{q} \in \mathbb{Z} \bigwedge 1 \leq k \leq m \right)$$

$$\text{gcd}(n_1, n_2, \dots, n_m) = p /; \text{Re}(p) \in \mathbb{Z} \bigwedge \text{Im}(p) \in \mathbb{Z} \bigwedge \text{Re}\left(\frac{n_k}{p}\right) \in \mathbb{Z} \bigwedge \text{Im}\left(\frac{n_k}{p}\right) \in \mathbb{Z} \bigwedge 1 \leq k \leq m \bigwedge \left( \neg \exists_q (|q| > |p| \wedge \text{Re}(q) \in \mathbb{Z} \wedge \text{Im}(q) \in \mathbb{Z}) \bigwedge \text{Re}\left(\frac{n_k}{q}\right) \in \mathbb{Z} \bigwedge \text{Im}\left(\frac{n_k}{q}\right) \in \mathbb{Z} \bigwedge 1 \leq k \leq m \right)$$

$$\text{lcm}(n_1, n_2, \dots, n_m) = p /; p \in \mathbb{N}^+ \bigwedge \frac{p}{n_k} \in \mathbb{Z} \bigwedge 1 \leq k \leq m \bigwedge \left( \neg \exists_q q < p \bigwedge p \in \mathbb{Z} \bigwedge \frac{q}{n_k} \in \mathbb{Z} \bigwedge 1 \leq k \leq m \right)$$

$$\text{lcm}(n_1, n_2, \dots, n_m) = p /; \text{Re}(p) \in \mathbb{Z} \bigwedge \text{Im}(p) \in \mathbb{Z} \bigwedge \text{Re}\left(\frac{p}{n_k}\right) \in \mathbb{Z} \bigwedge \text{Im}\left(\frac{p}{n_k}\right) \in \mathbb{Z} \bigwedge 1 \leq k \leq m \bigwedge \left( \neg \exists_q (\text{RAbs}(q) < |p| \wedge \text{Re}(q) \in \mathbb{Z} \wedge \text{Im}(q) \in \mathbb{Z}) \bigwedge \text{Re}\left(\frac{q}{n_k}\right) \in \mathbb{Z} \bigwedge \text{Im}\left(\frac{q}{n_k}\right) \in \mathbb{Z} \bigwedge 1 \leq k \leq m \right)$$

$$\text{egcd}(n_1, n_2, \dots, n_m) = \{\text{gcd}(n_1, n_2, \dots, n_m), \{r_1, r_2, \dots, r_m\}\} /;$$

$$\text{gcd}(n_1, n_2, \dots, n_m) = n_1 r_1 + n_2 r_2 + \dots + n_m r_m \wedge \text{Re}(n_k) \in \mathbb{Z} \wedge \text{Im}(n_k) \wedge \text{Re}(r_k) \in \mathbb{Z} \wedge \text{Im}(r_k) \in \mathbb{Z} \wedge 1 \leq k \leq m.$$

$\text{gcd}(n_1, n_2, \dots, n_m)$  is the greatest common divisor of the integers (or rational)  $n_k$ . It is the greatest integer factor common to all the  $n_k$ ,  $1 \leq k \leq m$ .

$\text{lcm}(n_1, n_2, \dots, n_m)$  is the least common multiple of the integers (or rational)  $n_k$ . It is the minimal positive integer that divides all the  $n_k$ ,  $1 \leq k \leq m$ .

$\text{egcd}(n_1, n_2, \dots, n_m)$  is the extended greatest common divisor of the integers  $n_k$ . In particular,

$$\text{egcd}(m, n) = \{\text{gcd}(m, n), \{r, s\}\} /; \text{gcd}(m, n) = m r + n s \wedge$$

$$\text{Re}(m) \in \mathbb{Z} \wedge \text{Im}(m) \wedge \text{Re}(n) \in \mathbb{Z} \wedge \text{Im}(n) \in \mathbb{Z} \wedge \text{Re}(r) \in \mathbb{Z} \wedge \text{Im}(r) \wedge \text{Re}(s) \in \mathbb{Z} \wedge \text{Im}(s) \in \mathbb{Z}.$$

Examples:

The greatest common divisor of 21 and 48,  $\text{gcd}(21, 48)$  is 3. Similar examples are  $\text{gcd}(27, 48, 36) = 3$ ,  $\text{gcd}(27 + 3i, 48 - 6i) = 3 + 3i$ ,  $\text{gcd}(\frac{2}{3}, \frac{3}{4}) = \frac{1}{12}$ .

The least common multiple of the three numbers 2, 4, and 5,  $\text{lcm}(2, 4, 5)$  is 20. Similar examples are  $\text{lcm}(27, 48, 36) = 432$ ,  $\text{lcm}(27 + 3i, 48 - 6i) = 222 + 216i$ ,  $\text{lcm}(\frac{2}{3}, \frac{3}{4}) = 6$ .

The extended greatest common divisor of 21 and 48  $\text{egcd}(21, 48)$  is  $\{3, \{7, -3\}\}$  because the greatest common divisor  $\text{gcd}(21, 48) = 3$  and  $21 \times 7 + 48(-3) = 3$ . Similarly,

$$\text{egcd}(15 - 9i, 5 - 7i) = \{1 + i, \{2 - 4i, -7 + 6i\}\} /; .$$

$$1 + i = \text{gcd}(15 - 9i, 5 - 7i) = (-7 + 6i)(5 - 7i) + (2 - 4i)(15 - 9i)$$

## Connections within the group of the GCD and LCM and with other function groups

### Representations through equivalent functions

The functions  $\text{gcd}(n_1, n_2, \dots, n_m)$  and  $\text{lcm}(n_1, n_2, \dots, n_m)$  satisfy the following interrelations:

$$\text{gcd}(n, m) = \frac{n m}{\text{lcm}(n, m)} /; m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$$

$$\text{gcd}(n_1, n_2, \dots, n_m) = \frac{(\prod_{k_1=1}^m n_{k_1}) \times (\prod_{k_1=1}^m \prod_{k_2=k_1+1}^m \prod_{k_3=k_2+1}^m \text{lcm}(n_{k_1}, n_{k_2}, n_{k_3})) \dots}{(\prod_{k_1=1}^m \prod_{k_2=k_1+1}^m \text{lcm}(n_{k_1}, n_{k_2})) \times (\prod_{k_1=1}^m \prod_{k_2=k_1+1}^m \prod_{k_3=k_2+1}^m \prod_{k_4=k_3+1}^m \text{lcm}(n_{k_1}, n_{k_2}, n_{k_3}, n_{k_4})) \dots}$$

$$\text{lcm}(n, m) = \frac{n m}{\text{gcd}(n, m)} /; m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$$

$$\text{lcm}(n, m, k) \text{gcd}(n m, m k, k n) = n m k /; \{n, m, k\} \in \mathbb{Z}$$

$$\text{gcd}(\text{lcm}(k, m), \text{lcm}(k, n), \text{lcm}(m, n)) = \text{lcm}(\text{gcd}(k, m), \text{gcd}(k, n), \text{gcd}(m, n)) /; \{n, m, k\} \in \mathbb{Z}.$$

## The best-known properties and formulas of the GCD and LCM

### Specific values for specialized variables

The functions GCD and LCM  $\text{gcd}(n_1, n_2, \dots, n_m)$ ,  $\text{egcd}(n_1, n_2, \dots, n_m)$ , and  $\text{lcm}(n_1, n_2, \dots, n_m)$  have the following values for specialized values:

<b>gcd</b>	<b>egcd</b>	<b>lcm</b>
$\text{gcd}(n) =  n $	$\text{egcd}(n) = \{ n , \{\text{sgn}(n)\}\}$	$\text{lcm}(n) =  n $
$\text{gcd}(0, n) = n$	$\text{egcd}(0, n) = \{ n , \{0, \text{sgn}(n)\}\}$	$\text{lcm}(0, n) = 0$
$\text{gcd}(n, n) =  n $	$\text{egcd}(n, n) = \{ n , \{0, \text{sgn}(n)\}\}$	$\text{lcm}(n, n) =  n $
$\text{gcd}(n, -n) =  n $	$\text{egcd}(n, -n) = \{ n , \{0, -\text{sgn}(n)\}\}$	$\text{lcm}(n, -n) =  n $
$\text{gcd}(n_1, n_1, \dots, n_1) =  n_1 $	$\text{egcd}(n_1, n_2, \dots, n_p) = \{ n_1 , \{m_1, m_2, \dots, m_{p-1}, \text{sgn}(n_1)\}\} /;$ $n_1 = n_2 = \dots = n_p \wedge m_1 = m_2 = \dots = m_{p-1} = 0$	$\text{lcm}(n_1, n_1, \dots, n_1) =  n_1 $
$\text{gcd}(p_1, p_2) = 1 /;$ $p_1 \neq p_2 \wedge p_1 \in \mathbb{P} \wedge p_2 \in \mathbb{P}$		$\text{lcm}(p_1, p_2) = p_1 p_2 /;$ $p_1 \neq p_2 \wedge p_1 \in \mathbb{P} \wedge p_2 \in \mathbb{P}$
$\text{gcd}(n, \text{lcm}(m, n)) = n /;$ $m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$		$\text{lcm}(n, \text{gcd}(m, n)) = n /;$
$\text{gcd}(n, \text{lcm}(p, q)) = \text{lcm}(\text{gcd}(n, p), \text{gcd}(n, q)) /;$ $n \in \mathbb{N}^+ \wedge p \in \mathbb{N}^+ \wedge q \in \mathbb{N}^+$		$\text{lcm}(n, \text{gcd}(p, q)) = \text{gcd}(n, \text{lcm}(p, q)) /;$ $n \in \mathbb{N}^+ \wedge p \in \mathbb{N}^+ \wedge q \in \mathbb{N}^+$
$\text{gcd}(\text{lcm}(n, p), \text{lcm}(n, q)) = \text{lcm}(n, \text{gcd}(p, q)) /;$ $n \in \mathbb{N}^+ \wedge p \in \mathbb{N}^+ \wedge q \in \mathbb{N}^+$		$\text{lcm}(\text{gcd}(n, p), \text{gcd}(n, q)) = \text{gcd}(n, \text{lcm}(p, q)) /;$ $n \in \mathbb{N}^+ \wedge p \in \mathbb{N}^+ \wedge q \in \mathbb{N}^+$
$\text{gcd}(\text{lcm}(k, m), \text{lcm}(k, n), \text{lcm}(m, n)) = \text{lcm}(\text{gcd}(k, m), \text{gcd}(k, n), \text{gcd}(m, n)) /;$ $k \in \mathbb{N}^+ \wedge m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$		$\text{lcm}(\text{gcd}(k, m), \text{gcd}(k, n), \text{gcd}(m, n)) = \text{gcd}(\text{lcm}(k, m), \text{lcm}(k, n), \text{lcm}(m, n)) /;$ $k \in \mathbb{N}^+ \wedge m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$

$$\text{gcd}(n \bmod m, m) = \text{gcd}(n, m) /; m \in \mathbb{N}^+$$

$$\text{gcd}(2^m - 1, 2^n - 1) = 2^{\text{gcd}(m,n)} - 1 /; m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+$$

$$\text{gcd}(F_m, F_n) = F_{\text{gcd}(m,n)} /; m \in \mathbb{Z} \wedge n \in \mathbb{Z}.$$

The first values of the greatest common divisor ( $\text{gcd}(m, n)$ ) of the integers  $m$  and  $n$  for  $1 \leq m \leq 20$  and  $1 \leq n \leq 20$  are described in the following table:

$m \setminus n$	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
2	1	2	1	2	1	2	1	2	1	2	1	2	1	2	1	2	1	2	1	2
3	1	1	3	1	1	3	1	1	3	1	1	3	1	1	3	1	1	3	1	1

20	1	2	1	4	5	2	1	4	1	10	1	4	1	2	5	4	1	2	1	20

The first values of the extended greatest common divisor ( $egcd(m, n)$ ) of the integers  $m$  and  $n$  for  $1 \leq m \leq 10$  and  $1 \leq n \leq 10$  are described in the following table:

$m \setminus n$	1	2	3	4	5	6	7	8	9	10
1	{1, {0, 1}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}	{1, {1, 0}}
2	{1, {0, 1}}	{2, {0, 1}}	{1, {-1, 1}}	{2, {1, 0}}	{1, {-2, 1}}	{2, {1, 0}}	{1, {-3, 1}}	{2, {1, 0}}	{1, {-4, 1}}	{2, {1, 0}}
3	{1, {0, 1}}	{1, {1, -1}}	{3, {0, 1}}	{1, {-1, 1}}	{1, {2, -1}}	{3, {1, 0}}	{1, {-2, 1}}	{1, {3, -1}}	{3, {1, 0}}	{1, {0, 1}}
4	{1, {0, 1}}	{2, {0, 1}}	{1, {1, -1}}	{4, {0, 1}}	{1, {-1, 1}}	{2, {-1, 1}}	{1, {2, -1}}	{4, {1, 0}}	{1, {-2, 1}}	{2, {0, 1}}
5	{1, {0, 1}}	{1, {1, -2}}	{1, {-1, 2}}	{1, {1, -1}}	{5, {0, 1}}	{1, {-1, 1}}	{1, {3, -2}}	{1, {-3, 2}}	{1, {2, -1}}	{1, {0, 1}}
6	{1, {0, 1}}	{2, {0, 1}}	{3, {0, 1}}	{2, {1, -1}}	{1, {1, -1}}	{6, {0, 1}}	{1, {-1, 1}}	{2, {-1, 1}}	{3, {-1, 1}}	{1, {0, 1}}
7	{1, {0, 1}}	{1, {1, -3}}	{1, {1, -2}}	{1, {-1, 2}}	{1, {-2, 3}}	{1, {1, -1}}	{7, {0, 1}}	{1, {-1, 1}}	{1, {4, -3}}	{1, {0, 1}}
8	{1, {0, 1}}	{2, {0, 1}}	{1, {-1, 3}}	{4, {0, 1}}	{1, {2, -3}}	{2, {1, -1}}	{1, {1, -1}}	{8, {0, 1}}	{1, {-1, 1}}	{1, {0, 1}}
9	{1, {0, 1}}	{1, {1, -4}}	{3, {0, 1}}	{1, {1, -2}}	{1, {-1, 2}}	{3, {1, -1}}	{1, {-3, 4}}	{1, {1, -1}}	{9, {0, 1}}	{1, {0, 1}}
10	{1, {0, 1}}	{2, {0, 1}}	{1, {1, -3}}	{2, {1, -2}}	{5, {0, 1}}	{2, {-1, 2}}	{1, {-2, 3}}	{2, {1, -1}}	{1, {1, -1}}	{1, {0, 1}}

The first values of the least common multiple ( $lcm(m, n)$ ) of the integers  $m$  and  $n$  for  $1 \leq m \leq 20$  and  $1 \leq n \leq 20$  are described in the following table:

$m \setminus n$	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

### Analyticity

The functions  $\text{gcd}(n_1, n_2, \dots, n_m)$  and  $\text{lcm}(n_1, n_2, \dots, n_m)$  are nonanalytical functions defined over  $\mathbb{Z}^m$  with values in  $\mathbb{Z}$ .

The function  $\text{egcd}(n_1, n_2, \dots, n_m)$  is a vector-valued nonanalytical function defined over  $\mathbb{Z}^m$ .

### Periodicity

All three functions  $\text{gcd}(n_1, n_2, \dots, n_m)$ ,  $\text{egcd}(n_1, n_2, \dots, n_m)$ , and  $\text{lcm}(n_1, n_2, \dots, n_m)$  do not have periodicity.

### Parity and symmetry

The functions  $\text{gcd}(n_1, n_2, \dots, n_m)$  and  $\text{lcm}(n_1, n_2, \dots, n_m)$  are even functions:

$$\text{gcd}(-n_1, -n_2, \dots, -n_m) = \text{gcd}(n_1, n_2, \dots, n_m)$$

$$\text{gcd}(-n_1, n_2, \dots, n_m) = \text{gcd}(n_1, n_2, \dots, n_m)$$

$$\text{lcm}(-n_1, -n_2, \dots, -n_m) = \text{lcm}(n_1, n_2, \dots, n_m)$$

$$\text{lcm}(-n_1, n_2, \dots, n_m) = \text{lcm}(n_1, n_2, \dots, n_m).$$

The functions  $\text{gcd}(n_1, n_2, \dots, n_m)$  and  $\text{lcm}(n_1, n_2, \dots, n_m)$  have permutation symmetry:

$$\text{gcd}(m, n) = \text{gcd}(n, m)$$

$$\text{gcd}(n_1, n_2, \dots, n_k, \dots, n_j, \dots, n_m) = \text{gcd}(n_1, n_2, \dots, n_j, \dots, n_k, \dots, n_m) ; n_k \neq n_j \wedge k \neq j$$

$$\text{lcm}(m, n) = \text{lcm}(n, m)$$

$$\text{lcm}(n_1, n_2, \dots, n_k, \dots, n_j, \dots, n_m) = \text{lcm}(n_1, n_2, \dots, n_j, \dots, n_k, \dots, n_m) /; n_k \neq n_j \wedge k \neq j.$$

### Series representations

The function  $\text{gcd}(m, n)$  has the following sum representations:

$$\text{gcd}(m, n) = m + n - mn + 2 \sum_{k=1}^{m-1} \left\lfloor \frac{kn}{m} \right\rfloor$$

$$\text{gcd}(m, n) = 1 - 2 \left\lfloor \frac{m}{2} \right\rfloor \left\lfloor \frac{n}{2} \right\rfloor - \delta_{\frac{m}{2}} \left\lfloor \frac{m}{2} \right\rfloor \delta_{\frac{n}{2}} \left\lfloor \frac{n}{2} \right\rfloor + 2 \sum_{k=1}^{\left\lfloor \frac{m}{2} \right\rfloor} \left\lfloor \frac{kn}{m} \right\rfloor + 2 \sum_{k=1}^{\left\lfloor \frac{n}{2} \right\rfloor} \left\lfloor \frac{km}{n} \right\rfloor,$$

where  $\lfloor p \rfloor$  is the floor function and  $\delta_q$  is the Kronecker delta function.

### Product representations

The functions  $\text{gcd}(n_1, n_2)$  and  $\text{lcm}(n_1, n_2)$  have the following product representations:

$$\text{gcd}(n_1, n_2) = \prod_{j=1}^{j_k} p_{i,j}^{\min(\alpha_{1,j}, \alpha_{2,j})} /;$$

$$n_1 \in \mathbb{N}^+ \wedge n_2 \in \mathbb{N}^+ \wedge \text{factors}(n_k) = \{ \{p_{k,1}, \alpha_{k,1}\}, \dots, \{p_{k,j_k}, \alpha_{k,j_k}\} \} \wedge p_{k,j} \in \mathbb{P} \wedge \alpha_{k,j} \in \mathbb{N}^+ \wedge 1 \leq k \leq 2$$

$$\text{lcm}(n_1, n_2) = \prod_{j=1}^{j_k} p_{i,j}^{\max(\alpha_{1,j}, \alpha_{2,j})} /;$$

$$n_1 \in \mathbb{N}^+ \wedge n_2 \in \mathbb{N}^+ \wedge \text{factors}(n_k) = \{ \{p_{k,1}, \alpha_{k,1}\}, \dots, \{p_{k,j_k}, \alpha_{k,j_k}\} \} \wedge p_{k,j} \in \mathbb{P} \wedge \alpha_{k,j} \in \mathbb{N}^+ \wedge 1 \leq k \leq 2.$$

### Generating functions

The function  $\text{gcd}(k, n)$  can be represented as the coefficients of the series expansion of corresponding generating functions, which includes a sum of the Euler totient function:

$$\sum_{k=1}^{\infty} \text{gcd}(k, n) x^k = \sum_{d|n} \phi(d) \frac{x^d}{1 - x^d}.$$

### Transformations with multiple arguments

The GCD and LCM functions  $\text{gcd}(n_1, n_2, \dots, n_m)$ ,  $\text{egcd}(n_1, n_2, \dots, n_m)$ , and  $\text{lcm}(n_1, n_2, \dots, n_m)$  satisfy special relations including multiple arguments, for example:

$$\text{gcd}(p n_1, p n_2, \dots, p n_m) = p \text{gcd}(n_1, n_2, \dots, n_m) /; p \in \mathbb{N}$$

$$\text{gcd}(m \mu, n \nu) = \text{gcd}(m, n) \text{gcd}(\mu, \nu) \text{gcd}\left(\frac{m}{\text{gcd}(m, n)}, \frac{\nu}{\text{gcd}(\mu, \nu)}\right) \text{gcd}\left(\frac{n}{\text{gcd}(m, n)}, \frac{\mu}{\text{gcd}(\mu, \nu)}\right) /;$$

$$m \in \mathbb{N}^+ \wedge n \in \mathbb{N}^+ \wedge \mu \in \mathbb{N}^+ \wedge \nu \in \mathbb{N}^+.$$

### Identities

The GCD and LCM functions satisfy some parallel identities that can be presented in the forms shown in the following table:

<b>gcd</b>	<b>lcm</b>
$\text{gcd}(\text{gcd}(m, n), p) = \text{gcd}(m, \text{gcd}(n, p))$	$\text{lcm}(\text{lcm}(m, n), p) = \text{lcm}(m, \text{lcm}(n, p))$
$\text{gcd}(n_1, \text{gcd}(n_2, n_3, \dots, n_m)) = \text{gcd}(n_1, n_2, n_3, \dots, n_m)$	$\text{lcm}(n_1, \text{lcm}(n_2, n_3, \dots, n_m)) = \text{lcm}(n_1, n_2, n_3, \dots, n_m)$
$\text{gcd}(m, n, p) = \text{gcd}(m, \text{gcd}(n, p))$	$\text{lcm}(m, n, p) = \text{lcm}(m, \text{lcm}(n, p))$

**Summation**

There are many finite and infinite sums containing GCD and LCM functions, for example:

$$\sum_{k_1=1}^n \sum_{k_2=1}^n \dots \sum_{k_m=1}^n F(\text{gcd}(k_1, k_2, \dots, k_m)) = \sum_{k=1}^n f(d) \left[ \frac{n}{d} \right]^m ; F(n) = \sum_{d|n} f(d)$$

$$\sum_{n=1}^{\infty} \sum_{k=1}^n \frac{\delta_{1,\text{gcd}(k,n)}}{k n (k+n)} = \frac{5}{4}$$

$$\sum_{n=1}^{\infty} \sum_{k=1}^n \frac{\delta_{1,\text{gcd}(k,n)}}{n^2 (k+n)} = \frac{3}{4}$$

$$\sum_{n=1}^{\infty} \sum_{k=1}^n \frac{\delta_{1,\text{gcd}(k,n)}}{k n (k+n)^2} = \frac{3}{8}$$

$$\sum_{n=1}^{\infty} \sum_{k=1}^n \frac{\delta_{1,\text{gcd}(k,n)}}{(k n (k+n))^2} = \frac{7}{24}$$

$$\sum_{b=1}^{\infty} \sum_{d=1}^{\infty} \frac{\delta_{1,\text{gcd}(b,d)}}{(b d (b+d))^2} = \frac{1}{3}$$

**Limit operation**

The following two related limits include the function  $\text{gcd}(n_1, n_2, \dots, n_m)$ . The third limit includes  $\text{lcm}(n_1, n_2, \dots, n_m)$ :

$$\lim_{n \rightarrow \infty} \frac{1}{n^2} \sum_{k=1}^n \sum_{l=1}^n \delta_{1,\text{gcd}(k,l)} = \frac{6}{\pi^2}$$

$$\lim_{n \rightarrow \infty} \frac{1}{n^r} \sum_{k_1=1}^n \sum_{k_2=1}^n \dots \sum_{k_r=1}^n \text{gcd}(k_1, k_2, \dots, k_r)^k = \frac{\zeta(r-k)}{\zeta(r)}$$

**Inequalities**

The functions  $\text{gcd}(n_1, n_2, \dots, n_m)$  and  $\text{lcm}(n_1, n_2, \dots, n_m)$  satisfy various inequalities, for example:

$$\gcd(n_1, n_2, \dots, n_k) \operatorname{lcm}(n_1, n_2, \dots, n_k)^{k-1} \leq \prod_{j=1}^k n_j \leq \gcd(n_1, n_2, \dots, n_k)^{k-1} \operatorname{lcm}(n_1, n_2, \dots, n_k) /;$$

$$n_1 \in \mathbb{N}^+ \wedge n_2 \in \mathbb{N}^+ \wedge \dots \wedge n_k \in \mathbb{N}^+ \wedge k \in \mathbb{N}^+$$

$$\operatorname{lcm}(1, 2, \dots, n) \geq 2^{n-2} /; n \in \mathbb{N}^+.$$

### Applications of the GCD and LCM

The GCD and LCM functions have numerous applications throughout mathematics, number theory, symbolic algorithms, and linear Diophantine equations.
